Generating PDFs

Front matter

Take a look at the source code for this page (src/content/02-markdown/02-generating-pdf.md) and see the starting block being fenced by --- dashes. This is the front matter commonly used in many Markdown-based applications.

The pdf field is set to true in this case, which instructs Mathlified to generate a PDF into the output directory of the project root.

Prerequisite

To make use of this feature, \$\LaTeX\$, djot and pandoc will need to be installed locally on your machine.

Triggering PDF generation

PDF generation is triggered while in dev mode and on file change.

To see it in action, make sure your dev server is running (with pnpm run dev or equivalent). Make some changes to this file. Upon saving, you should see a success/failure message printed on the terminal. Give it a try!

The pdf generation feature of Mathlified only runs on file changes during dev mode.
